DETAILED ACTION

Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance: Regarding claim 1, the prior art of record, Monod (US Pat# 5,293,400) teaches a bidirectional inductive channel 20 (Fig. 1) between the first device 10 (Fig. 1, left box) and the second device 10 (Fig. 1, right box), first transmission means 12 and 16 (Fig. 1, left box) for transmitting a power signal at a first frequency from the first device to the second device 10 (Fig. 1, left box) over the inductive channel 20 (Fig. 1), a first modulating device 12 and 16 (Fig. 1, left box) for modulating a first data signal at a first modulation frequency, a second modulating device 12 and 16 (Fig. 1, right box) for modulating a second data signal at a second modulation frequency (Monod does not specifically teaches a second frequency, but it would be obvious that the oscillator can be set at a different frequency from the other device), second transmission means 12 and 16 (Fig. 1, right box) for transmitting the modulated first data signals from the first device to the second device over the inductive channel 20 (Fig. 1), and for transmitting the modulated second data signals from the second device to the first device over the inductive channel, wherein the transmission system furthermore comprises detection means for demodulating 24 (Fig. 1,) the first data signal at the first device 10 (Fig. 1, left box) and demodulating the second data signal 24 (Fig. 1, right box) at the second device 10 (Fig. 1, right box), and signal cancellation means 28 (Fig. 1) for cancellation of the first data signal from the second data signal received at the first device 10 (Fig. 1, left box) and

cancellation of the second data signal 28 (Fig. 1, right box) from the first data signal received at the second device 10 (Fig. 1, right box).

Thomas (WO 95/07521) teaches a bidirectional inductive channel (Fig. 1) between the first device and the second device, first transmission means for transmitting a power signal at a first frequency from the first device to the second device over the inductive channel (Fig. 1), a first modulating device for modulating a first data signal at a first modulation frequency (Fig. 1), a second modulating device for modulating a second data signal at a second modulation frequency (abstract, page 4 lines 1-3), second transmission means for transmitting the modulated first data signals from the first device to the second device over the inductive channel (abstract, page 4 lines 1-3), and for transmitting the modulated second data signals from the second device to the first device over the inductive channel.

Poletto (US Pat# 6,741,845) teaches modulation frequency an even factor apart (abstract and Col. 1 lines 31-38).

Monod, Thomas, and Poletto teaches all the limitations of claim 1. However, the examiner does not think it would be reasonable to combine Monod, Thomas, and Poletto together. Plus, making the obvious statement that the oscillators could be set to create an even factor apart in Monod and Thomas is not clearly supported by either reference therefore the Examiner concedes that neither Monod nor Thomas clearly teaches the frequencies being an even factor apart. Further, applicant's remarks made on 6/5/2008 further states reasons for allowance.

The prior art of record fails to teach the claimed subject matter as claimed and substantially connected in claims 1-6.

Regarding claim 7, method claim 7 is allowed for the same reason as apparatus claim 1 since the recited elements would perform the claimed steps.

The prior art of record fails to teach the claimed subject matter as claimed and substantially connected in claims 7-14.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Anderson discloses an electromagnetic tracking system and method using a single-coil transmitter. Ruemmer discloses a method for adjustment of a transmitter carrier frequency in a subscriber station of a point-to-multipoint radio transmission system. Solonen discloses a synchronizing a mobile station transmission. Strohallen discloses a low power wireless communication system employing magnetic control zones. Healy discloses a cryptographic authentication for telemetry with an implantable medical device. Crowe discloses power transfer of direct current with inductive couplings.
